GUIDELINES

Tips for publishing your Workflow template on UiPath Connect

Written by Parth Doshi

Do not use any thrid-party website or applications instead use an API.
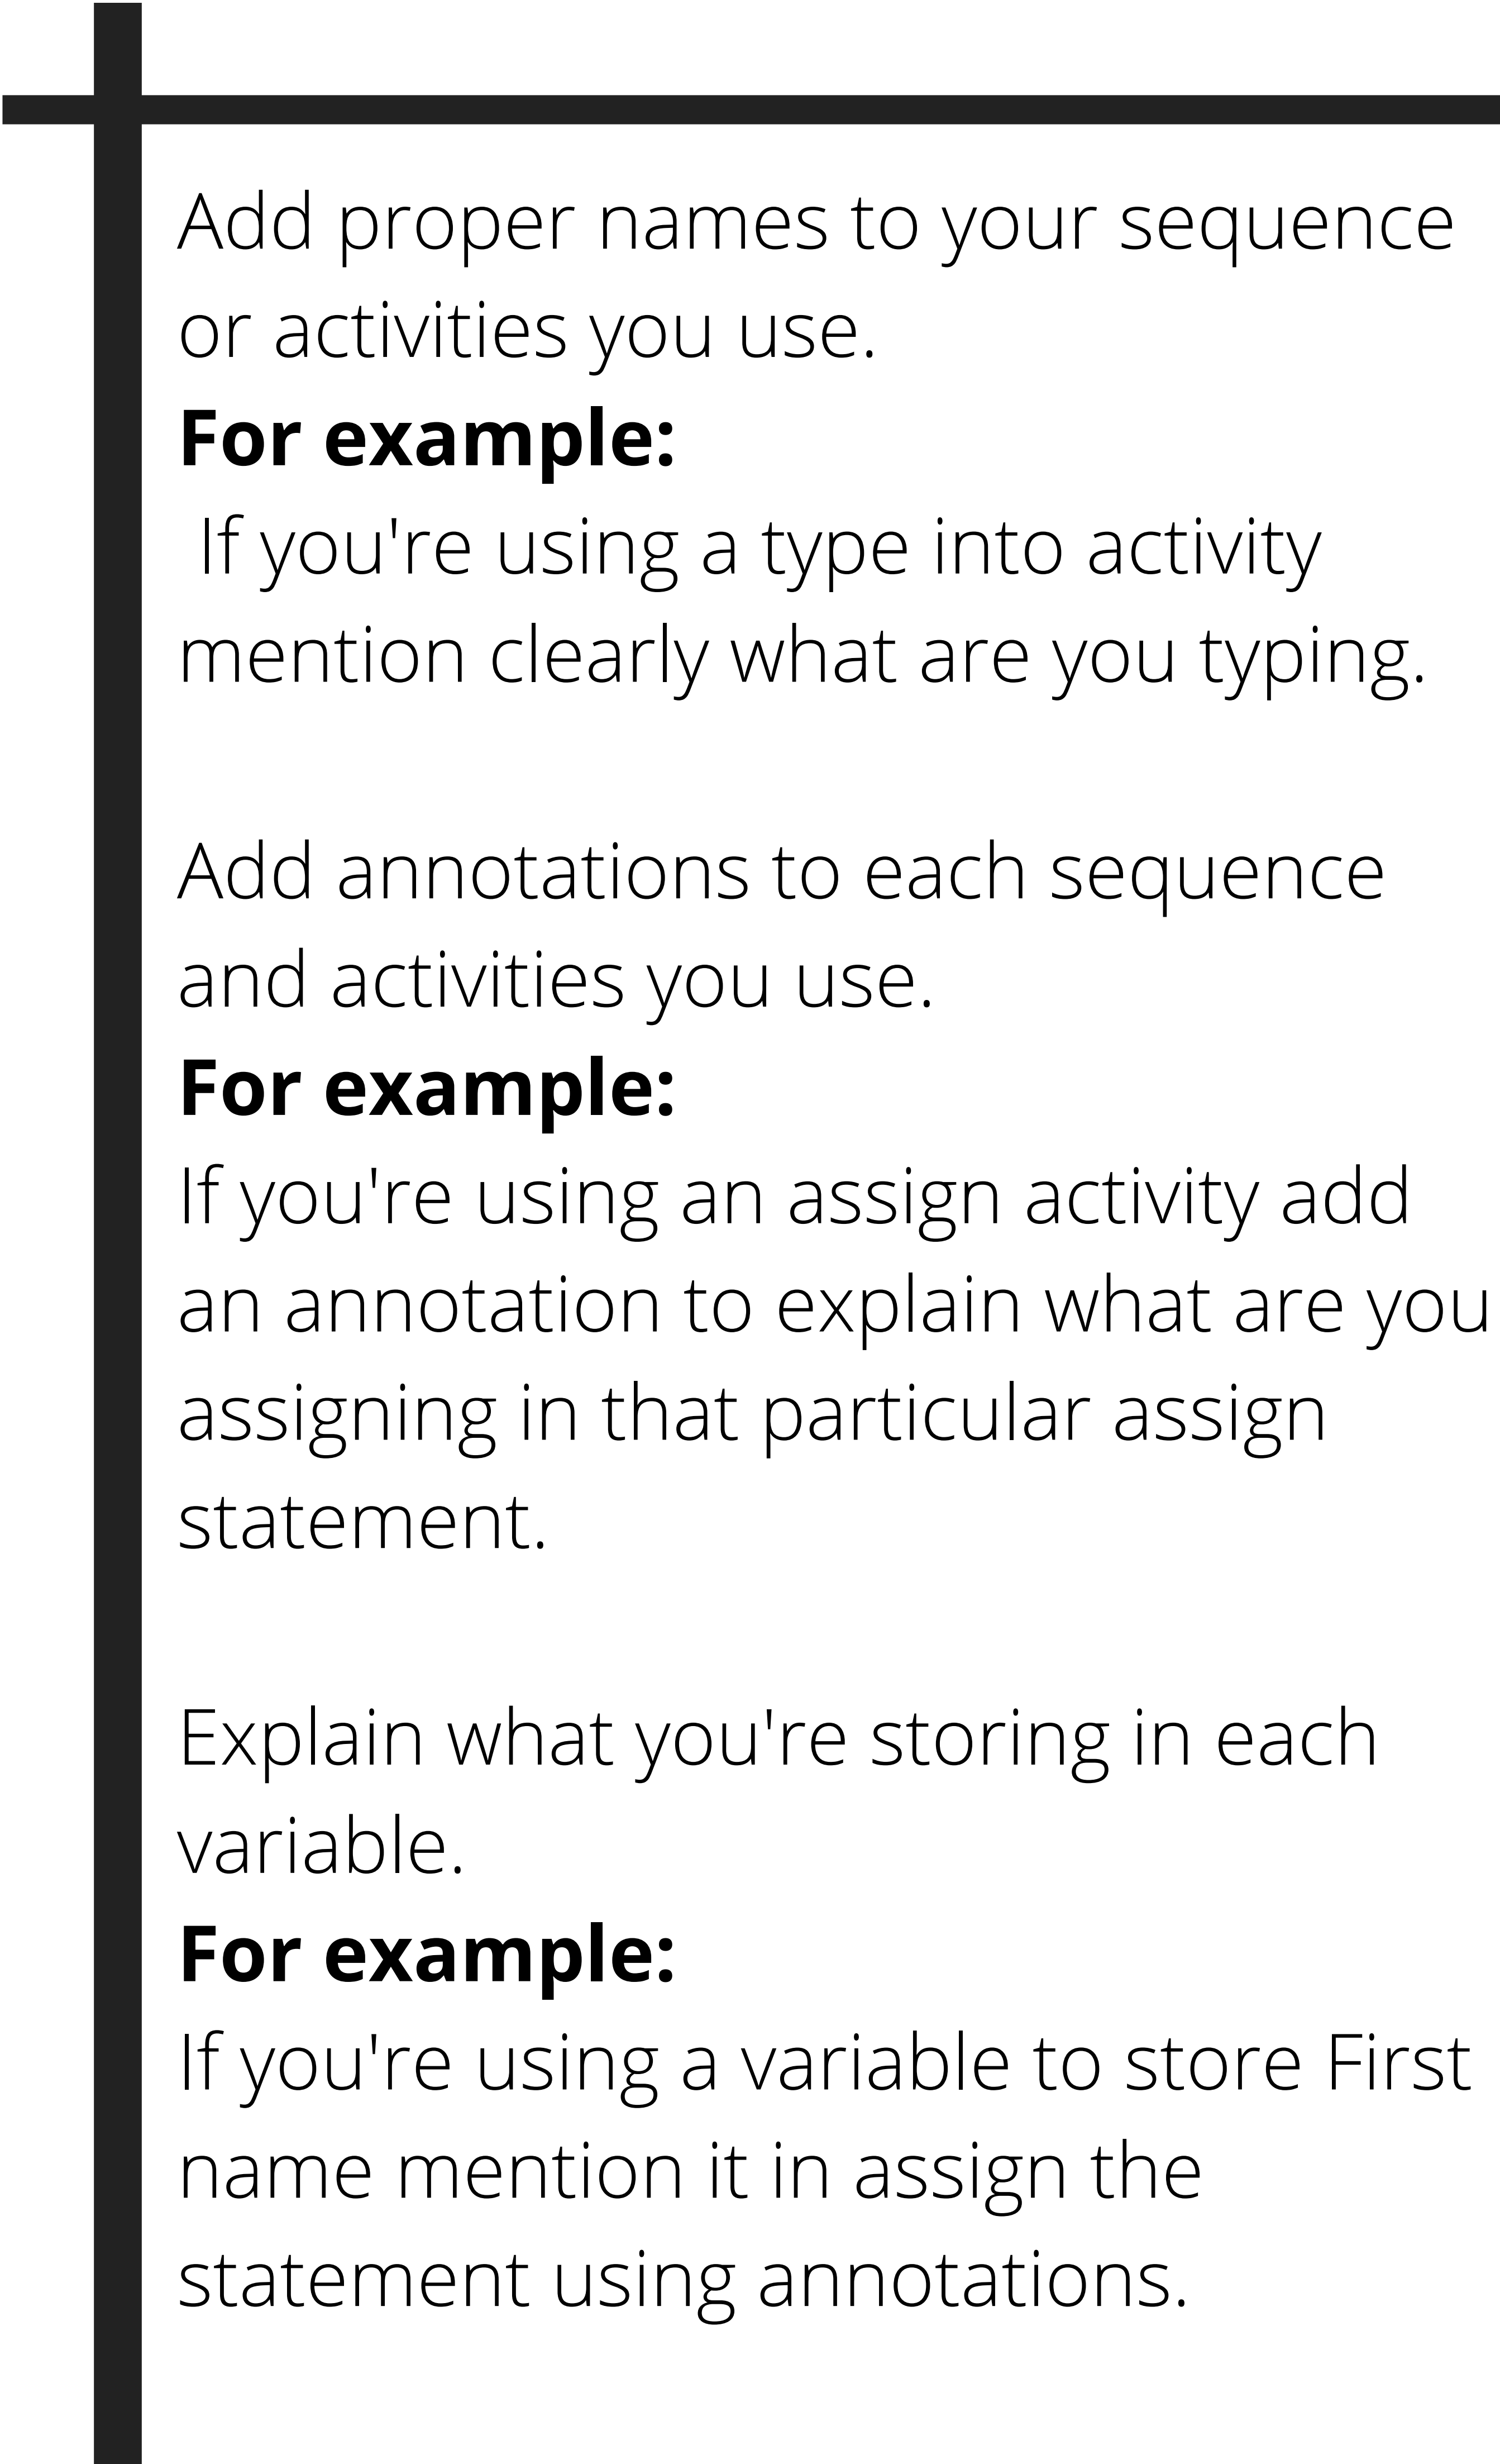

For example:
If you are extracting weather details of locations instead of using any browser to extract data use an API.

If you are using any Mail activity add an annotation to explain that to whom is that mail being sent to.

For example:
If you're using an mail activity for sending confirmation of registration explain it using annotation.

Remove your credentials like email ID and password from the workflow and mention that here the credentials need to be given when using

Add proper names to your sequence or activities you use.

For example:

If you're using a type into activity mention clearly what are you typing.

Add annotations to each sequence and activities you use.

For example:

If you're using an assign activity add an annotation to explain what are you assigning in that particular assign statement.

Explain what you're storing in each variable.

For example:

If you're using a variable to store First name mention it in assign the statement using annotations.

Mention all the dependencies required to run your workflow.
For example:
If you're writing into an excel file you require Excel dependencies so mention that while publishing.

Remove unwanted dependencies from the workflow before publishing and keep only the required ones.

Give proper name to your variables and arguments.
For example:
If you're using a variable to store First name keep the variable name as First_Name other example could be mention the direction of argument in it's name.

Create a README.md file for your workflow it will help the end-user to understand the steps to run your workflow.

Create a demo video and add it's link while uploading the workflow on UiPath Connect.

Also add some media pictures of your workflow and output.

Write a proper summary and description for your workflow and also mention the benefits of your workflow.

GUIDELINES

Tips for publishing your Snippet on UiPath Connect

Written by Parth Doshi

If your workflow can be reused in some application then select the type as Snippet while submitting on UiPath Connect.

Input from the user should be kept in arguments. So that it can be imported in workflow.
For Example:
If you're taking Email ID as input keep it as an argument.

Remove unwanted arguments from your snippet.

Remove Get Password activity if you're already taking password in an argument.

The direction of your argument should be mentioned properly.

For Example:

- If the input is required from the user, then keep it as *Input.*
- If output is generated from arguments keep it as *Output.*
- If the input is taken from the user and given back to the user then keep it as *In/Out.*

Make sure all the spelling in annotations and sequence are correct.

Do not abruptly close your workflow make sure there is a proper end-point to it.

Give proper naming to variables, arguments and write annotations.

Following all the above mentioned guidelines I have published my component on UiPath Connect.

Workflow Template:

Appointment Manager For Clinic:
https://connect.uipath.com/marketplace/components/appointment-manager-for-clinic

If you follow all the above mentioned guidelines your component might get approved in the first go itself.
